# glue and stringr

glue and stringr are tidyverse packages for string injection and manipulation

# glue and stringr

glue and stringr are tidyverse packages for string injection and manipulation

String manipulation is essential for data science

# glue and stringr

glue and stringr are tidyverse packages for string injection and manipulation

String manipulation is essential for data science

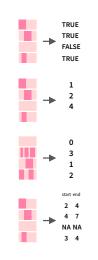

We will pay special attention to *regular expressions*: strings that signify special patterns of characters in other stings

#### Work with strings with stringr:: CHEAT SHEET

The stringr package provides a set of internally consistent tools for working with character strings, i.e. sequences of characters surrounded by quotation marks.

#### **Detect Matches**

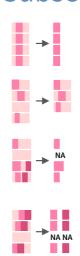

str\_detect(string, pattern) Detect the presence of a pattern match in a string. str\_detect(fruit, "a")

str\_which(string, pattern) Find the indexes of strings that contain a pattern match. str\_which(fruit, "a")

str\_count(string, pattern) Count the number of matches in a string. str count(fruit, "a")

**str\_locate**(string, **pattern**) Locate the positions of pattern matches in a string. Also str\_locate\_all. str locate(fruit, "a")

#### **Subset Strings**

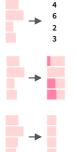

**str\_sub**(string, start = 1L, end = -1L) Extract substrings from a character vector. str\_sub(fruit, 1, 3); str\_sub(fruit, -2)

**str\_subset**(string, **pattern**) Return only the strings that contain a pattern match. str subset(fruit, "b")

**str\_extract**(string, **pattern**) Return the first pattern match found in each string, as a vector. Also **str\_extract\_all** to return every pattern match. str\_extract(fruit, "[aeiou]")

**str\_match**(string, **pattern**) Return the first pattern match found in each string, as a matrix with a column for each () group in pattern. Also **str\_match\_all**. str\_match(sentences, "(a|the) ([^ ]+)")

#### Manage Lengths

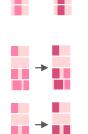

str\_length(string) The width of strings (i.e. number of code points, which generally equals the number of characters). str\_length(fruit)

**str\_pad**(string, width, side = c("left", "right", "both"), pad = " ") Pad strings to constant width. str\_pad(fruit, 17)

str\_trunc(string, width, side = c("right", "left", "center"), ellipsis = "...") Truncate the width of strings, replacing content with ellipsis. str\_trunc(fruit, 3)

str\_trim(string, side = c("both", "left", "right")) Trim whitespace from the start and/or end of a string. *str\_trim(fruit)* 

#### **Mutate Strings**

A STRING

a string

a string

A STRING

a string

**str\_sub() <-** value. Replace substrings by identifying the substrings with str\_sub() and assigning into the results. str sub(fruit, 1, 3) <- "str"

str\_replace(string, pattern, replacement) Replace the first matched pattern in each string. str\_replace(fruit, "a", "-")

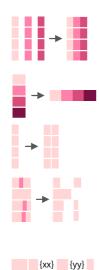

str\_replace\_all(string, pattern, replacement) Replace all matched patterns in each string. str\_replace\_all(fruit, "a", "-")

str\_to\_lower(string, locale = "en")¹ Convert strings to lower case. str\_to\_lower(sentences)

str to upper(string, locale = "en")1 Convert strings to upper case. str\_to\_upper(sentences)

str\_to\_title(string, locale = "en")1 Convert strings to title case. str\_to\_title(sentences)

#### Join and Split

str\_c(..., sep = "", collapse = NULL) Join
multiple strings into a single string. str\_c(letters, LETTERS)

str\_c(..., sep = "", collapse = NULL) Collapse a vector of strings into a single string. str\_c(letters, collapse = "")

str\_dup(string, times) Repeat strings times times. str\_dup(fruit, times = 2)

str\_split\_fixed(string, pattern, n) Split a vector of strings into a matrix of substrings (splitting at occurrences of a pattern match). Also **str\_split** to return a list of substrings. str\_split\_fixed(fruit, " ", n=2)

glue::glue(..., .sep = "", .envir =
parent.frame(), .open = "{", .close = "}") Create
a string from strings and {expressions} to
evaluate. glue::glue("Pi is {pi}")

glue::glue\_data(.x, ..., .sep = "", .envir =
parent.frame(), .open = "{", .close = "}") Use a data frame, list, or environment to create a string from strings and {expressions} to evaluate. glue::glue\_data(mtcars, "{rownames(mtcars)} has {hp} hp")

#### **Order Strings**

str\_order(x, decreasing = FALSE, na last = TRUE, localé = "en", numeric = FALSE, ...)¹ Return the vector of indexes that sorts a character vector. *x*[*str\_order*(*x*)]

str\_sort(x, decreasing = FALSE, na\_last = TRUE, locale = "en", numeric = FALSE, ...) Sort a character vector. str sort(x)

#### Helpers

**str\_conv**(string, encoding) Override the encoding of a string. str\_conv(fruit,"ISO-8859-1")

apple banana

apple banana pear

str\_view(string, pattern, match = NA) View HTML rendering of first regex match in each string. str\_view(fruit, "[aeiou]")

**str\_view\_all**(string, **pattern**, match = NA) View HTML rendering of all regex matches. str view all(fruit, "[aeiou]")

**str\_wrap**(string, width = 80, indent = 0, exdent = 0) Wrap strings into nicely formatted paragraphs. str\_wrap(sentences, 20)

glue's main function is glue() which creates strings and can inject R objects into strings

glue's main function is glue() which creates strings and can inject R objects into strings

glue() has two arguments we are interested in:

- 1. String(s) with ...
- 2. How to separate the elements with sep

glue's main function is glue() which creates strings and can inject R objects into strings

glue() has two arguments we are interested in:

- 1. String(s) with ...
- 2. How to separate the elements with sep

```
glue("Hello, my name is Grant Innerst")
Hello, my name is Grant Innerst
```

glue's main function is glue() which creates strings and can inject R objects into strings

glue() has two arguments we are interested in:

- 1. String(s) with ...
- 2. How to separate the elements with sep

```
glue("Hello, my name is Grant Innerst")
Hello, my name is Grant Innerst
```

You "inject" R code into the string with { }

glue's main function is glue() which creates strings and can inject R objects into strings

glue() has two arguments we are interested in:

- 1. String(s) with ...
- 2. How to separate the elements with sep

```
glue("Hello, my name is Grant Innerst")
Hello, my name is Grant Innerst

You "inject" R code into the string with {}

first_name <- "Grant"; last_name <- "Innerst"
glue("Hello, my name is {first_name} {last_name}")
Hello, my name is Grant Innerst</pre>
```

```
name <- "Grant"
age <- 26
anniversary <- as.Date("2018-07-14")

glue('My name is {name},',
   ' my age next year is {age + 1},',
   ' my anniversary is {format(anniversary, "%A, %B %d, %Y")}.')</pre>
```

My name is Grant, my age next year is 27, my anniversary is Saturday, July 14, 2018.

glue has other functions that perform more specific tasks

glue has other functions that perform more specific tasks glue\_data() works well with pipes and exposes LHS names

glue has other functions that perform more specific tasks glue\_data() works well with pipes and exposes LHS names glue\_collapse() collapses a character vector into one string

glue has other functions that perform more specific tasks glue\_data() works well with pipes and exposes LHS names glue\_collapse() collapses a character vector into one string glue\_col() colors console output of strings

glue has other functions that perform more specific tasks glue\_data() works well with pipes and exposes LHS names glue\_collapse() collapses a character vector into one string glue\_col() colors console output of strings etc...

### glue in the wild!

The bertini package

stringr is much more extensive package for string manipulation

stringr is much more extensive package for string manipulation

stringr functions will almost always start with str\_

stringr is much more extensive package for string manipulation

stringr functions will almost always start with str\_

stringr functions are wrappers of a very fast C++ library called stringi. stringi is powerful but complicated

stringr is much more extensive package for string manipulation

stringr functions will almost always start with str\_

stringr functions are wrappers of a very fast C++ library called stringi. stringi is powerful but complicated

stringr functions can be grouped into six categories

- Detecting
- Lengthening
- Joining/Splitting
- Subsetting
- Mutating
- Sorting/Ordering
